

Reflection

I learnt to put to work my knowledge from the AWS Well Architected Framework as well as the Cloud Adoption framework. Although the likely issues were not explicitly explained, safe assumptions based on the background provided as well as further research on what can be problematic when it comes to a two-tiered architecture application helped pinpoint the likely issues that the company may face. With the help of AI, I was also able to explain further certain issues and also utilize it in creating a better architecture that ensures security as well as reliability. This project has helped me appreciate the practicality of cloud frameworks and its usefulness overall.
